TG_MTTH coordinate (bp)
Construct segments and junction types
mouse genomic flank
homology arm (mouse sequence)
human insert
J2: human/mouse junction (sequence-detectable)
J1: HA/endogenous boundary (seamless by design)
Junction-spanning read support per sample (greyscale + hatch = samples; deliberately achromatic, unrelated to the segment colours above)
MTTH_284
MTTH_412
MTTH_524
reads spanning junction
(>=10 bp aligned on both sides)

Shaded groups (J1): the homology arm is identical to the endogenous locus, so these reads cannot be assigned to one
or the other — the aligner splits them arbitrarily and reports MAPQ 0. J1 counts are therefore NOT a measure of evidence
strength and are not comparable with J2 counts. Only J2 reads (MAPQ 60) uniquely identify the targeted allele.
